

ABSTRACT

A portable terminal device (1) at least transmits a customer ID of a user and billing account information of any billing account of a plurality of
5 billing accounts; the user is identified by the customer ID transmitted from the portable terminal device (1) based on a customer ID of the user and plural pieces of billing account information related to the customer ID, which are previously stored in a customer database (41) of a control server (3); a billing
10 account to which a cost is charged is determined from among the plurality of accounts opened by the identified user by the billing account information transmitted from the portable terminal device (1). Thereby, a cost for goods or service can be charged to a desired account among the plurality of accounts.
